```
detected in humans infected with B. burgdorferi. S.c. injection of mice
               proteins were prepd. A humoral response to P35 and P37 was
           P37 proteins were mapped to sep. plasmids. Antibodies to these
        genes were isolated and sequenced. The genes for the P21, P35 and
antisera from mice infected with live B. burgdorferi spirochetes. Several
    with antisera from mice inoculated with killed B. burgdorferi and with
were identified by differential screening of a B. burgdorferi DNA library
infection of mice but not expressed by in vitro cultures of B. burgdorferi
 selectively expressed in vivo is also disclosed. Genes expressed during
antibodies are claimed. A method for identifying bacterial genes that are
      antibodies to these proteins, and diagnostic use of the proteins and
       identified. Vaccines comprising the novel B. burgdorferi proteins,
      cultures of B. burgdorferi, as well as genes for these proteins, are
are produced during infection of a host but are not expressed by in vitro
          Lyme disease are disclosed. Novel B. burgdorferi proteins which

  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

flagellar genes is evidently different from that of other bacteria. in the later stage of flagellar assembly, the regulation of B. burgdorferi 70-like promoter rather than a unique flagellar sigma factor is involved promoter element into the promoter probe cat vector. Because a sigma promoter element, no activity was detected after subcloning a flab the putative sigma gp3-34-like promoter for flab. In contrast to the flgk consistent with the presence of a sigma 70-like promoter in addition to downstream of the reported start site. The sequence around -10 and -35 are transcription of this gene. A transcriptional start point was found 1 bp sigma gp33-34-like promoter has been reported to be involved in the flab) was re-examined. flab encodes the flagellar filament protein, and a bromoter element of the flagellin gene (fla, hereafter referred to as the flgk promoter was still functional. Based on these results, the typhimurium which lacked a functional flagellar-specific sigma 28 factor, In addition, when this construct was transformed into a flih mutant of S. had strong activity in both Escherichia coli and Salmonella typhimurium.

onter speath of Flak proteins and a core of most other spirochete species are complex: these PFs contain an Borrelia burgdorferi are composed of only one flagellin protein. The PFs Most investigators have assumed that the periplasmic flagella (PFs) of

terminus. Based on reverse transcription-PCR and primer extension B. burgdorferi Flah has a conserved signal sequence at its N Flak from other spirochetes. Like other Flak proteins, homolog with a deduced polypeptide having 54 to 58% similarity to of B. burgdorferi 212, we were surprised to find a flam gene filament of Flab proteins. During an analysis of a chemotaxis gene cluster

from Treponema pallidum and a lysate of B. burgdorferi showed strong a motility-chemotaxis operon. Immunoblots using anti-Flah serum analysis, this flam homolog and five chemotaxis genes constitute

reactivity to a protein of 38.0 kDa, which is

consistent with the expression of flat in growing cells.

TITLE:

A chemotaxis gene cluster from Borrelia burgdorferi, the spirochete that ΆA ENTRY MONTH: TIL66T

bacteria. chemotaxis apparatus of B. burgdorferi compared to those of other results taken together suggest both similarities and differences in the consistent with two cheA homologs being present in this organism. The two reactive proteins in the cell lysates of B. burgdorferi that is Western blot analysis using antibody to Escherichia coli CheA resulted in genes and the upstream flagellar gene flam constitute an operon. Gram-positive bacteria. RT-PCR analysis indicated that the chemotaxis branch with Treponema pallidum and is closely associated with Archea and analysis of CheY indicated that B. burgdorferi constitutes a distinct significantly different from the homolog of other bacteria. Phylogenetic for B. burgdorferi CheW and CheY were well conserved, the size of cheW was reading frame we identified as cheX. Although the major functional domains contained three chemotaxis gene homologs (cheA, cheW and cheY) and an open causes Lyme disease, was cloned, sequenced, and analyzed. This cluster

the surface of the mycobacteria. Mycobacteria which may be transformed protein or fragment by enabling the protein or fragment to be expressed on fragment. Such expression vectors increase the immunogenicity of the protein comprising a lipoprotein or lipoprotein segment and the protein or

protein or fragment is described. The mycobacteria express a fusion thereof, which is heterologous to the mycobacteria which express the lipoprotein, and a second DNA sequence encoding a protein, or fragment comprises a first DNA sequence encoding at least a secretion signal of a Yu expression vector for expressing a protein in mycobacteria, which

toward elucidation of a possible role of chemotaxis in virulence of the B. afZelii, resp. Identification of cheA and cheW is the first step on the linear chromosomes of B. burgdorferi sensu stricto, B. garinii and cheA and cheW form an operon with an upstream, unidentified ORF. The cheA and cheW homologs were located at 722-737 kbp, 738-768 kbp and 743-824 kpb

bacterial CheW. Using reverse transcription PCR, we demonstrated that 195-amino-acid protein which displayed a high level of similarity to immediately downstream from the putative borrelial cheA gene encoded a

location of the histidine autophosphorylation domain very close to the N particular, hallmarks of a histidine kinase family were found such as the identical residues) to the CheA of several genera of eubacteria. In encoding an 864-amino-acid protein with significant similarity (53-64.6% obtained from the CT strain identified a 2,592-bp open reading frame (ORF)

gene walking PCR and construction of a .lambda. library were used to identify the putative cheA gene. Sequence anal. of the DNA fragments

as polymerase chain reaction (PCR) using degenerate primers, random-primed and cheW were cloned and characterized. A combination of strategies such

terminus and the nucleotide-binding site. A second ORF located

An Escherichia coli clone containing recombinant plasmid Cl9 was **AA** 

identified from a Treponema pallidum genomic DNA library by in situ

protein doublet of 39.2 and 38.2 kDa, designated immunoassay. E. coli maxicells containing pCl9 synthesized a treponemal

amino acids with a calculated molecular mass of 37.9 kpa The tpn38(b) gene is 1029 nucleotides long and encodes a protein of 343 fragment of pCl9 containing the tpn38(b) gene was subcloned and sequenced. is synthesized with a cleavable amino-terminal signal peptide. A 2.0-kb TpN38(b). Pulse-chase and protein processing studies showed that TpN38(b)

pallidum TpN35 lipoprotein and the Borrelia burgdorferi BmpA, BmpB, BmpC, . The deduced amino acid sequence of TpN38(b) has homology with the T.

and BmpD proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                       |                  |                                       |
|      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                       |                  |                                       |

HT31 is the type strain. propose the name Borrelia miyamotoi sp. nov. for this spirochete; strain isolates should be classified as members of a new Borrelia species. We Thus, the spirochetes isolated from I. persulcatus and closely related previously described Lyme disease borreliae and relapsing fever borreliae. The results showed that isolate HT31T is only distantly related to both matrix analyses were performed, and a phylogenetic tree was constructed. aligned with the 165 rRNA sequences of other Borrelia species. Distance sequence (length, 1,368 nucleotides) of strain HT31T was determined and of DNA relatedness with strain HT31T. In addition, the 16S rRNA gene Mone of the previously described species examined exhibited a high level burgdorferi, Borrelia garinii, and Borrelia afzelii) were only 8 to 13%. reassociation with the previously described Lyme disease borreliae (B. Borrelia parkeri, and Borrelia coriaceae. However, the levels of DNA levels of DNA relatedness (24 to 51%) with Borrelia hermsii, B. turicatae, hybridization experiments revealed that strain HT31T exhibited moderate DNA base composition of strain HT31T was 28.6 mol% G+C. DNA-DNA strain) had the same 23S rRNA gene physical map as Borrelia turicatae. The

TITLE:

reported for this antigen. The lowest reactive antigen had an M(r) of (p93) and had an NHZ-terminal sequence identical to the one previously strains. The reactive antigen with the highest  $M(\mathbf{r})$  was measured at 93 kDa whole-cell lysate of several American and European Borrelia burgdorferi in a Western blot (immunoblot) with approximately 30 polypeptides from a An immunoglobulin M kappa-chain murine monoclonal antibody (CAB) reacted

identity with glyceraldehyde-3-phosphate dehydrogenase of other bacteria molecular mass of approximately 38.5 kDa had a strong procked to Edman degradation. Finally, one sequenced polypeptide with a burgdorferi. Two other antigens at approximately 49 and 47 kDa were approximately 72-kDa polypeptide to be identical to the Dnak homolog of B. Amino-terminal sequences of other reactive polypeptides showed one internal and thus less likely to be degraded by experimental procedures. insoluble fraction of a Triton X-114 partition indicated that they were treatment of intact organisms and recovery of the antigens in the likely not due to the action of endogenous proteases. Likewise, protease reactivity, indicating that if such degradation existed, it was most burgdorferi with protease inhibitors did not result in changes in CAB could recognize shared epitopes in different antigens. Treatment of B. degradation of p93 has already been reported, and to determine whether CAB degradation of the antigen with the highest M(r), since such spontaneous study was to determine whether the broad reactivity of CAB could be due to narrow acidic range, between 5.4 and 6.2. Thus, the objective of this 16,000. All antigens recognized by CAB had isoelectric points within a

Searched by Barb O'Bryen, STIC 308-4740

acid residues 357 to 371 of p93 was identified. Evidence is presented for five, unrelated antigens of B. burgdorferi. A linear epitope within amino indicate the presence of a shared epitope in at least three, possibly reactivity may be due to fragmentation of p93, there is strong evidence to and vertebrates. Thus, while it cannot be ruled out that some of the CAB

The aim of this study was to investigate the morphological changes of ЯA

presence of "spheroplasts" at the same concentration. (iv) Structural sheath at a penicillin concentration of 0.125 mg/l. (iii) The waveform of the borrelial cells and complete loss of the outer penicillin concentration of 0.0625 mg/l. (ii) A characteristic irregular discovered: (i) Numerous outer sheath blebs at a opserved by electron microscopy. The following alterations were cysrscferistic ultrastructural changes when exposed to penicillin, were morphological structures of untreated spirochetes, as well as their (MIC) was determined to be 0.5 mg/l by broth dilution method. The penicillin G for 5 days. The in vitro minimal inhibitory concentration medium and exposed to increasing concentrations  $(0.0625 \text{ mg/L}^{-2} \text{ mg/L})$  of B. burgdorferi from an erythema migrans lesion was cultivated in BSK II Borrelia burgdorferi associated with penicillin treatment. An isolate of

protoplasmic cylinder complex into several parts at penicillin pattern at a penicillin concentration of 0.125 mg/l. (v) Disruption of the changes of the protoplasmic cylinder complex which showed an irregular

penicillin concentrations of 1 mg/l and 2 mg/l. concentrations of 0.25 mg/l and 0.5 mg/l. (vi) Severe cytolysis at

of 35 kDa and 34.5 kDa. Immunoblot analysis using antiserum to the AF immunoblotting. Analysis by SDS-PAGE of the purified preparation showed sulphate polyacrylamide gel electrophoresis (SDS-PAGE), and The axial filament (AF) from Leptospira interrogans serovar canicola was English

the use of AF in immunodiagnosis of leptospirosis in other species. antigen source. It is suggested that these findings may be extrapolated to sonicated whole cells can substitute excellently for purified AF as the antigen for the serological diagnosis of leptospirosis in swine and that coucjnded that the AF-ELISA can be used effectively as a species-specific correlation was observed between AF-ELISA and WC-ELISA (r=0.97). It was cells (WC) of serovar canicola were used in an ELISA (WC-ELISA), high between titres detected in the AF-ELISA and the MAT. When sonicated whole in comparison to the MAT (r = 0.4). Only moderate correlation was observed serovars. A sensitivity of 97.1% and specificity of 93.1% was determined the microscopic agglutination test (MAT) against one or more leptospiral tested in an AF-ELISA against sera from 260 pigs, many of which reacted in burgdorferi but only a very minor reaction with leptospiral AF. The AF was hyodysenteriae showed a marked reaction with a 41 kDa band of B. not detect the leptospiral AF antigen. Immunoblots with antiserum to T. slightly in comparison to leptospiral AF. Antibody of B. burgdorferi did burgdorferi moderately and of Treponema hyodysenteriae only bratislava detected the 35 and 34.5 kDa AF bands to Borrelia at 33 and 32 kDa. Immunoblots with antiserum to whole cells of serovar Antisera prepared against leptospiral serovars also identified minor bands minor bands of molecular weight 43, 39 and 37 kDa. reaction against the 41, 35 and 34.5 kDa protein bands, as well as against against sonicated leptospires of a variety of serovars showed prominent relatively weak bands of molecular size 42 kDa and 21 kDa and strong bands microscopic examination, by protein-A immunogold labelling, sodium dodecyl sarcosyl treated whole cells. Isolation of AF was confirmed by electron isolated by caesium chloride density gradient centrifugation of 2%
